

**Starting with my skeleton code, implement both versions of FizzBuzz. Why am I asking you to do this? Note any interesting observations as you complete this task.**

- This practice teaches us ways to both use a void and string functions, one which does not have a return value and one that does
- As I tried to complete the second version which required us to return a string, I had to find a way to convert 'int n' into a string. This was done by using the `to_string()` method as well as adding `#include <string>` to the top of the code
